

CLAW INSURANCE

Privacy-first AI copilot for insurance advisors on WhatsApp

20+

paying users

2+ hours

saved per user per day

Real revenue

feedback-driven MVP

END-TO-END WORKFLOW

PROBLEM STATEMENT

Insurance advisors repeatedly answer product and policy questions in WhatsApp, while each reply depends on long client histories and sensitive personal data. Generic chatbots are fast but can leak private information, mix client context, or recommend products without reliable grounding.

SOLUTION OVERVIEW

Claw Insurance is a Docker-deployed local workspace that synchronizes WhatsApp conversations, keeps every client in an isolated session, and generates an editable reply draft. A human advisor reviews and sends the final message. The same workspace also supports catalog-grounded product matching and offline meeting-note transcription.

USE OF AI

Context: The prompt combines the selected client's isolated history, local memory, and the latest incoming message.

Grounding: An insurance-product advisor skill retrieves structured catalog evidence before drafting a recommendation.

Privacy: A local deterministic gateway masks names, phone numbers, chat IDs, policy numbers, and addresses before cloud inference; residual risk fails closed.

Control: The model produces a draft only. The same draft ID and phone number must be validated before a human-approved WhatsApp send.

PRODUCT WORKSPACE

One interface for clients, privacy status, AI drafts, approval, and meeting notes.

IMPACT & VALUE

The MVP has 20+ paying users, including advisors from Prudential and AIA, who report saving 2+ hours per day on repeated questions and follow-up drafts. Human approval and local privacy controls make the speed gain usable in a high-trust workflow.

REFLECTIONS

- Main challenges: WhatsApp connectivity, phone normalization, and the Docker-to-host browser boundary.
- Key lesson: per-client isolation, fail-closed privacy, and human approval make failures recoverable.
- Next: delivery receipts, NER-assisted redaction, automated draft evaluation, and deeper CRM/catalog integrations.
